

# Sustainable Supply Chain Management

Many organizations are beginning to move beyond managing their direct sustainability issues, and are looking to their value chain for opportunities to improve environmental and social impacts. In particular, customers are looking to their suppliers to improve their footprint. The implementation of a sustainable supply chain management program can reduce a company's cost and demand for resources, promote and safeguard employee health and morale, identify potential improvements in efficiency, and improve brand reputation.

Cameron-Cole, LLC has experience with a range of organizations in designing sustainable supply chain programs. We can help you evaluate your supply chain and the true costs associated with your products' manufacturing, materials, packaging, and disposal processes. Using life cycle analysis, we help clients address and improve their footprint by looking for opportunities with suppliers and analyzing the full downstream impacts of their products and services. We align our clients' supply chain

with other environmental and social initiatives within the organization, and implement monitoring and reporting systems to ensure the success of all programs.

We also participate in the technical working groups as part of the WRI/WBCSD Greenhouse Gas Protocol's Product and Supply Chain Accounting and Reporting Standard development process.

Our services include –

- Vendor sustainability evaluation and risk analysis
- Best practice benchmarking
- Sustainable supply chain management program design and auditing
- Environmentally Preferable Procurement program development and implementation
- Internal and external communication tools
- Training for employees and procurement officers
